

## Nerve Monitoring System

Nerve Monitoring System - an essential component of Microtia Repair

Microtia repair requires a surgeon to work in close proximity to the main facial nerve. If this nerve becomes damaged, it will lead to weakness or paralysis on half of the face. Clearly, in surgery this complex, it is imperative to maintain the highest standards in patient safety, so HUGS team of surgeons will closely monitor this nerve during the surgical procedure with our state-of-the-art Nerve Monitoring System. We have taken this piece of medical equipment with us on each medical mission in the past, but this is increasingly difficult to do partly because of the baggage restrictions on airplanes.

Today, you can make a dramatic difference in the life of a child . . . help us to procure this equipment. Your support has helped us accomplish many wonderful things in the past and we are counting on your continued assistance to help us accomplish this critical goal.. Please [CLICK HERE](#) to be sent to our donations page. Any amount is highly valued and appreciated! Thank you!

We would like to purchase the equipment to be permanently installed in the hospital in Quito for future missions. The cost of this equipment is \$29,500. Please join our valued group of Gracious Donors with your gift so that this important Nerve Monitoring System can add to the success of our missions! Please [click here](#) to help support HUGS. Any amount is highly valued and appreciated.
